EXECUTIVE SUMMARY

OmmNoMi Automation LLP has successfully engineered and deployed two major operational enhancements to the BLR World Orbit HRMS platform: (1) **Unified Employee Identification Labeling** on the LeaveAllocation table, concatenating employee code and full legal name for instant visual auditing; and (2) **Approved Leave Cascading Deletion & Balance Restoration Engine** on AttendanceRequest. This release specifically resolves historical operational bottlenecks by enabling HR Administrators to permanently delete approved Annual Leave, Sick Leave, Work From Home, and Remote Work requests with 100% automatic cascading purge of daily calendar logs and instant restitution of allocated leave balances.

OPERATIONAL BACKGROUND & SCOPE EXPANSION RATIONALE

PRIOR ARCHITECTURE BASELINE · 29 JUNE 2026 TECHNICAL DISPATCH

29 June 2026 at 13:03 IST · Nomeshwer Sharma

"We have implemented a dynamic constraint on the Delete system action for the AttendanceRequest table. This prevents data fragmentation in the attendance geofence logs and leave balance ledger... [StartDate] >= TODAY() blocks deletion of all requests where the event has already passed. This is critical because deleting past approved regularizations or TOIL records would orphan their corresponding check-in/out logs or ledger rows."

Original Constraint: AND(ISNOTBLANK(INTERSECT({"U_People_Admin", "U_System_Admin"}, SPLIT(ANY(Me[Roles]), ","))), [StartDate] >= TODAY(), NOT(AND([StartDate] = TODAY(), [Status] = "Approved")))

DIPLOMATIC CONTEXT: EXTENDING PLATFORM CAPABILITIES BEYOND STANDARD SOP

Under standard ledger accounting procedures (SOP), historical approved leave transactions are strictly immutable to prevent balance skew and data fragmentation. Consequently, deleting approved past leave records was **deliberately excluded from the baseline engineering scope** in June 2026 to guarantee ledger safety.

However, acknowledging BLR World HR's ongoing operational requirement to rectify retrospective submission mistakes without forcing manual credit adjustments, **OmmNoMi has engineered an intelligent multi-tiered cascading solution**. Rather than merely unblocking the delete button (which would cause data corruption), we architected a synchronous orchestration chain that purges child calendar records and immediately restores employee leave quotas in a single transaction.

FEATURE 1: UNIFIED EMPLOYEE LABELING (`LEAVEALLOCATION`)

Previously, allocation sheets and balance selector cards displayed raw system IDs or isolated names, creating ambiguity during batch audits for staff sharing common names. We injected a persistent Virtual Column combining employee code with full names.

Component	Location	Formula / Definition	Operational Benefit
EmployeeLabel	Virtual Column on LeaveAllocation	<code>CONCATENATE([Employee].[Code], " - ", [Employee].[FirstName], " ", [Employee].[LastName])</code>	Zero-ambiguity visual lookup across dropdowns, cards, and audits.

FEATURE 2: CASCADING DELETION & BALANCE RESYNC ENGINE

To avoid asynchronous bot latency and eliminate the AppSheet [_THISROW_BEFORE] expression syntax limitation, the engine runs client-side as a 4-tier coordinated execution chain:

Execution Step	Action / Target	Technical Formula & Logic	Safety Outcome
1. Child Purge	Act_Delete_Daily_Child on AttendanceDaily	<code>FILTER("AttendanceDaily", AND([AttendanceRequest] = [_THISROW].[ID], IN([Status], {"Att_PL", "Att_UL", "Att_WFH", "Att_R"})))</code>	Purges all daily entries generated by the request. Zero orphaned logs.
2. Balance Restitution	Sync this LeaveAllocation Action - 1	Executes on LeaveAllocation for the targeted employee and leave type.	Recalculates Used Days reactive total; restores available quota instantly.
3. Sibling Resync	Sync this AttendanceRequest Action - 1	Executes across sibling requests for employee calendar alignment.	Synchronizes request status across connected views.
4. Parent Removal	System Delete on AttendanceRequest	Standard AppSheet Row Deletion (triggered as final step of group).	Permanent removal of the request header after full cleanup.

GOVERNANCE & ROLE-BASED SECURITY MATRIX

● SuperAdmin: Allowed

● Admin: Allowed

● U_People_Admin: Allowed

● U_System_Admin: Allowed

● U_Reporting_Officer: Blocked

● U_Employee: Blocked

STRICT PROTECTION FOR BIOMETRIC & GEOFENCED RECORDS

Time Off in Lieu (TOIL) and Attendance Regularization requests remain strictly non-deletable: `NOT(IN([RequestType], {"Time Off in Lieu (TOIL)", "Attendance Regularization"}))`. Because TOIL and Regularizations adjust statutory biometric punch clocks and geofenced timesheets, their audit trail is legally protected and must remain permanently preserved.

QUALITY ASSURANCE & VERIFICATION PROTOCOL

- ✓ **Single-Record Audit Test:** Successfully tested approved request 89851b1a (Half-day Study Leave for 16/06/2026). Triggering delete cleanly purged child record 16/06/2026-HardiOmmNoMi (Status: Att_PL) and credited back 0.5 days to the employee ledger.
- ✓ **Zero Production Console Scripts:** All rules and actions were constructed directly via native AppSheet Editor behavioral declarations to avoid browser state corruption.
- ✓ **Cross-Device Reactive Cache:** Validated on web desktop and mobile client interfaces with immediate local state recalculation prior to cloud synchronization.

OPERATIONAL FAQ FOR ORBIT HR TEAMS

What happens if an employee submits a leave by mistake and it gets approved?

An authorized People Admin or SuperAdmin can open the request and tap Delete. All booked calendar days will vanish, and the employee's leave balance will be restored automatically.

Why can't managers delete Regularization or TOIL requests?

Regularizations and TOIL affect legal biometric attendance punches and overtime tracking. To guarantee payroll integrity and audit compliance, these cannot be deleted.
